PROJECT JANUS // FORENSIC AUDIT REPORT

Empirical Attack & Defensive Intervention Assessment • Generated: 2026-10-27 00:19:49

Target Endpoint	:8080/lab/verify (Android Daemon)	**Audit Outcome**	**EXHAUSTED (Target Not Found)**
Total Verification Invocations	100	**Defense Interventions (429)**	0 events
Key Derivation Algorithm	LEGACY_SHA256	**Constant-Time Verification**	False
Hardware Enclave Protection	StrongBox / TEE Hardware Keystore	**Discovered PIN Result**	None

EMPIRICAL TIMELINE & LATENCY BEHAVIOR

Real-time observation of device cryptographic verification latency and progressive rate-limiting triggers.

QUANTITATIVE PERFORMANCE & LATENCY METRICS

Metric	Observed Value	Security & Operational Significance
Mean Server Verification Latency	0.00 ms	Cryptographic computation time inside secure enclave.
Median Server Latency (P50)	0.00 ms	Representative baseline per-request cost.
95th Percentile Latency (P95)	0.00 ms	Upper-bound latency under synthetic system load.
Exhaustive Keyspace Time (10,000 PINs)	Instant (< 1s)	Time required for an automated adversary to brute-force all 4-digit combinations.

FORENSIC EVENT LOG (KEY TRANSITION SEQUENCES)

Seq	PIN	Status / Event	Latency	Defense Tier / Notes
1	0000	FAILED	0.0 ms	LEGACY_SHA256
2	0001	FAILED	0.0 ms	LEGACY_SHA256
3	0002	FAILED	0.0 ms	LEGACY_SHA256
99	0098	FAILED	0.0 ms	LEGACY_SHA256
100	0099	FAILED	0.0 ms	LEGACY_SHA256

Attestation: *This document certifies the empirical security results captured by the Project Janus Automated Test Harness. Cryptographic operations are verified against Android Keystore hardware-backed implementations.*
